

The background of the slide is a solid teal color. On the right side, there are several decorative elements: a large, semi-transparent pie chart with a smaller, darker teal circle inside it; three smaller, semi-transparent pie charts of varying sizes; and a bar chart at the bottom right with four vertical bars of increasing height from left to right. The left side of the slide is a large white rectangle.

**Atlanta Holochain Meetup 1/10/2018**

**What does it mean to be digitally sovereign?**

# Why Digital Sovereignty Collective ?

Founders:

Micah

Sophia

- Aims to provide a forum for diverse individuals from the tech, arts, food, and social justice spheres to converge and discuss how decentralized p2p tech can facilitate the emergence of grassroots economic alternatives.
- To decentralize power and weaken the hold of the tech monopolies Facebook, Google, Amazon, & Apple.
- To facilitate individual & collective sovereignty over our own data. (i.e. control over who has access to it and for what purposes, and the capacity to use our own data for the empowerment of our own communities)
- To enable cross-sector collaboration between community organizers, developers, and academics, so that our tech matches the needs of the people its intended to serve.

We see the accelerating change and adoption of technology to be happening on an evolutionary scale and we are here now to help facilitate the transition into a reality where the natural, spiritual and digital are in resonance and work together to manifest a diverse and resilient ecosystem of democratically-governed peoples.

# Holochain Community's Purpose

“In a period that is getting more volatile, uncertain, complex and ambiguous, humanity is facing enormous challenges as a species. We need to level up our game in terms of our ability to adapt and coordinate if we are going to succeed in facing those challenges.

Holochain's ambition: to bring humanity's capacity for coordination to a whole new level. In our view, that requires all sorts of new bottom-up coordination patterns -- patterns that are opted into, and more importantly renewed through ongoing use -- by the participants themselves. We see this as nature's preferred pattern for collaboration at a biological level. Making use of that same pattern at a social level will enable individuals and communities to be more responsive to shifting challenges and opportunities.” [Matt Schutte]

# Issues with Centralized Systems

Centralized Network

Decentralized Network

Distributed Network

Which looks strongest and most resilient?

On a centralized system,  
YOU can be:

Example

**X HACKED**

- Equifax: 143 million Americans' financial and personal data stolen
- Yahoo!: 3 billion users' identity data stolen
- Ashley Madison: infidelity website's list of 30 million customers released publicly

**X TRACKED**

- Google, Facebook, Amazon, and the NSA regularly monitor your Internet activity

**X CENSORED**

- China's Great Firewall blocks a variety of sites and content
- Spain blocked more than 140 political websites in attempt to disrupt the 2017 Catalan independence election

**X SHUT DOWN**

- Egypt turned off Internet access for entire population in 2011
- In 2016, Turkey shut down the Internet completely in 11 Kurdish cities

**X SOLD OUT**

- Delicious, Myspace, Ning, and Skype each sold out to larger companies

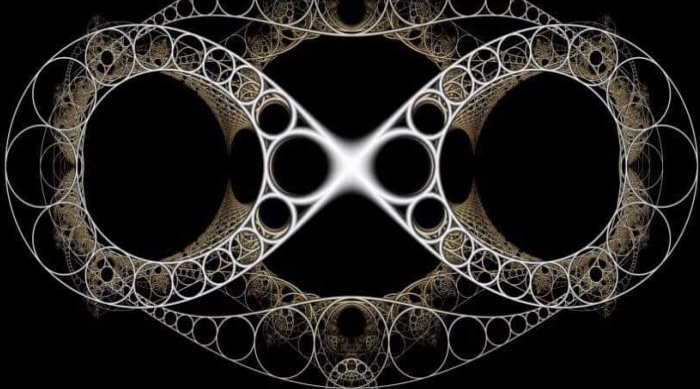

# Holochain vs Blockchain

**Holochain**

- Decentralized architecture
- Distributed application engine
- Secure hash chain
- DHT (Distributed Hash Table)
- Data integrity
- Custom data validation
- Scaling
- Load required for network

# Holochain vs Blockchain

“Blockchain is about managing a consensus about what was “said.” Holochain is about distributing a consensus about how to “speak” [Art Brock]

|                                | Current System  | Blockchain   | Holochain  |
|--------------------------------|---|--|--|
| <b>Security/Trust</b>          | Database held “securely” by third party   | Distributed Global Ledger of “Indisputable Truth”  | Community-set rules to play by + social accountability   |
| <b>Governance</b>              | Oligarchy   | “Consensus” & Smart Contracts  | Pluralistic commons  |
| <b>Model</b>                   | Dominance   | Liberty  | Holographic Coordination (Biomimicry)  |
| <b>Ontology</b>                | Corporation-centric   | Token-centric  | Agent-centric  |
| <b>Example</b> (Jamie Klinger) | A <b>centralized app</b> like <a href="#">Snapchat</a> offers you a small file (the app) to download that sends data through <b>centralized servers</b> . | A <b>decentralized app</b> like <a href="#">TenX</a> runs on a <b>decentralized blockchain</b> ( <a href="#">Ethereum</a> ). | A <b>decentralized app</b> like <a href="#">TenX</a> runs on a <b>decentralized blockchain</b> ( <a href="#">Ethereum</a> ). |

# Examples in Nature

## Human Language

- We are a speaker of a language when we know how to use the rules of that language properly
- We don't have to know all the same words (because we can use the rules to explain unknown ones)
- We don't need to have the same experiences
- We certainly don't need some global ledger of everything that's ever been said, or require consensus about what has been said
- Yet there are infinite possibilities for how we may communicate with one another within the boundaries of this language.

## Cells

- each cell carries a copy of their rules or instruction set (i.e. DNA)
- there is no global ledger about the state of trillions of cells
- Yet, our cells coordinate in a highly decentralized manner, without the latency or bottlenecks of central control

# Holochain vs Blockchain

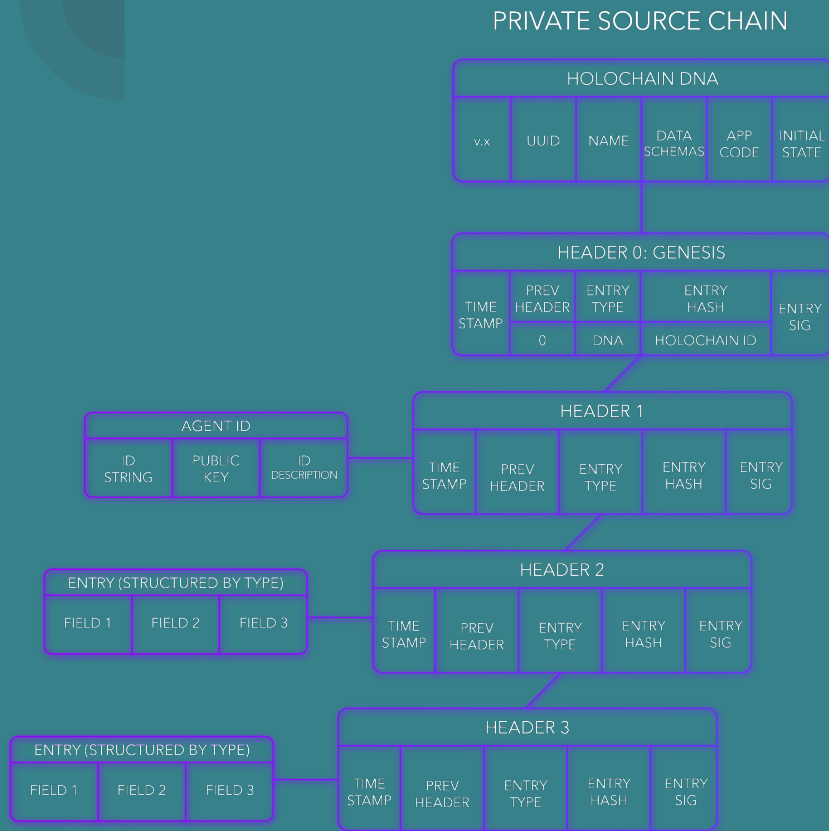

# Overview of Holochain Architecture

**What  
are  
D.H.Ts ?**

# Overview of Holochain Architecture

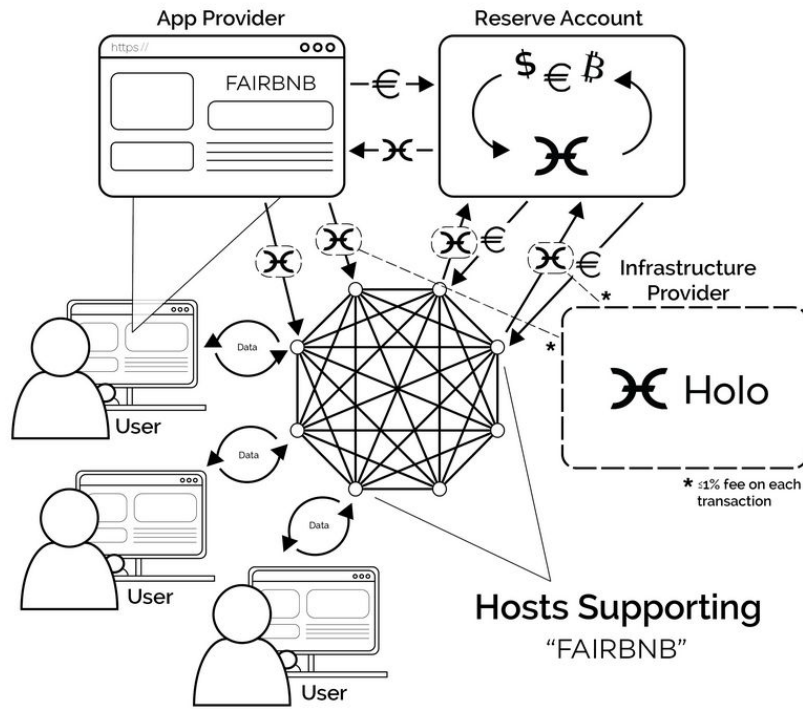

# Holochain vs Holo

- Architecture vs Application
- Accessibility to a beginning user
- First launch of a full scale application
- First launch of a token-less, mutual credit currency back by a real asset (computing power)

# Overview of Holo Ecosystem

# What are holochain applications best suited for?

- Governance, Collaboration, and Organizational Tools
- Social Networks and Social Media
- Platform Cooperatives
- Directly p2p sharing economy apps
- Community Resource Management (the Commons)
- Tokenless, mutual-credit cryptocurrencies and reputation systems
- Individual controlled data collection (e.g. in the Health sphere)
- Supply Chain & Open Value Networks

# Timeline

## Holo Ecosystem

- Crowdfunding campaign launches to distribute Holo hosting devices
- ICO raises capital for Holo, grows Holo network, and attracts developers for Holochain
- First HoloPorts ship to 600+ hosts
- First test transaction on Holo using Holo fuel
- Approaching 5,000 hosts
- 100 test transactions per hour on Holo using Holo fuel
- Test net of Holo running on 15,000 host devices
- Test net of Holo running on 30,000 host devices

Q4 2017

Q1 2018

Q2 2018

Q3 2018

Q4 2018

## Holochain Core and Apps

- Holochain Alpha 0 and Alpha 1 Release
- Prototype voting and decision-making apps
- Holochain Alpha 2 Release: High level application development framework and pluggable governance
- Holochain Alpha 3 Release: Security audit and the ability to adjust DHT parameters and behavior
- Core app services available: Package manager, Identity Services, Holochain Index, Smart Caching
- Holochain Beta Release: Continued backward compatibility and more security audits
- Holochain approaching production-level sophistication

# Where do we go from here?

Let's talk about it. What do you think?

- How do we want to organize future meetups?
- How can we co-learn?
- What are you excited about?
- How do you want to be involved?

# Connect with Community

Holochain Public Mattermost Chat: <https://chat.holochain.net>

- The Holochain Dev community is very responsive! Please ask questions here for more information about how Holochain works.
